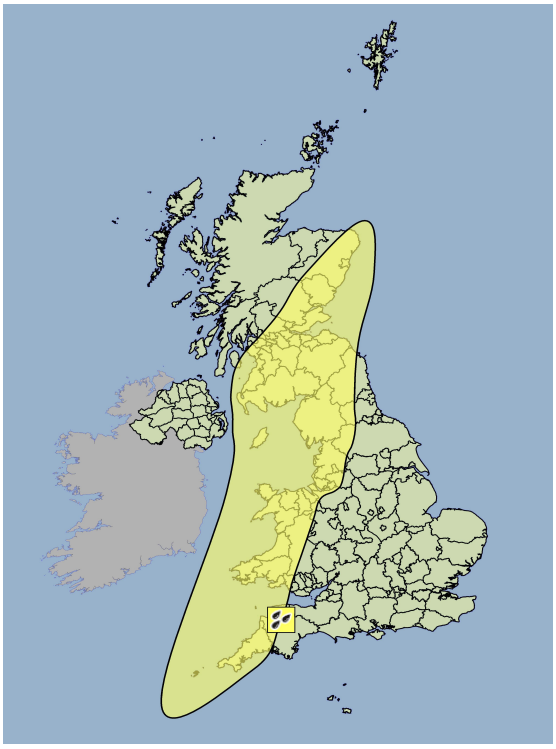
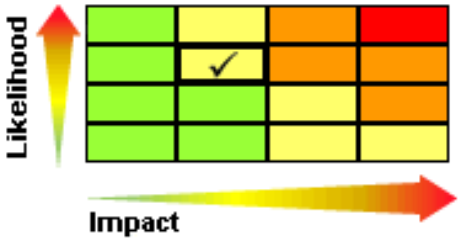
National Severe Weather Warning Service





Chief Forecasters Assessment
A developing area of low pressure is expected to track north across the UK through the weekend. The heaviest rainfall is currently expected to develop on the western flank of the low, with west Wales, some western fringes of England and southwest Scotland seeming most at risk from widespread 20 to 40 mm of rain, and locally perhaps exceeding 50 mm in 12 hours.

This is a complex situation, and the warning may well be updated again as the situation develops.

The Met Office have issued a **Yellow Warning** of **Rain**

Valid from **00:15 on Sat, 02nd Aug 2014** until **23:45 on Sat, 02nd Aug 2014**

An area of rain is expected to push north across the UK through Saturday. The rain will be persistent and sometimes heavy, especially across western areas at first, and later over northern areas. There remains some uncertainty in the eastward extent across England and Wales, and then, during the afternoon and evening, how far the rain will push into Scotland: there is the possibility that the warning area will be revised again, either later today or early on Saturday. The rain should clear much of southwest England and then parts of south Wales during the day. Strong winds will present an additional hazard later in the day along areas adjoining the northern part of the Irish Sea.

The public are advised to be aware of the risk of disruption to travel and outdoor activities due to localised surface water flooding.
